

COVID-19 can be serious for children.

In fact, over 700 children in the U.S under the age of 5 have died from COVID. Others have developed a condition that can affect their hearts, lungs, kidneys, and brains called Multisystem Inflammatory Syndrome in Children or MIS-C.

But you can protect your child.

COVID-19 vaccines are available for all children six months of age and older. The vaccines are made to be most effective against circulating strains of the virus. They are safe and are constantly monitored for any safety concerns.

Don't have insurance?

Not a problem! The Vaccines for Children program guarantees free vaccines to every child who does not have insurance. Scan the QR Code to learn more.
